## Physics 23 Problems Chapters 1-4 <br> Dr. Joseph F. Alward

Solutions are shown at the end.

## Chapter 1 Problems

1. Obtain the direction of the sum of the two displacement vectors, $\mathbf{A}$ and $\mathbf{B}$, below.

A: 56 km , west
B: $40 \mathrm{~km}, 30^{\circ}$ south of east
2. A hiker travels for 500 meters along a heading of $150^{\circ}$, then 700 meters along a heading of $260^{\circ}$. Along which heading could a second hiker, starting from the first hiker's initial location, travel to meet the first hiker?

## Chapter 2 Problems

## Horizontal Motion Problems

1. The velocity of an object traveling along the x -axis changes from $-40 \mathrm{~m} / \mathrm{s}$ to $70 \mathrm{~m} / \mathrm{s}$ in five seconds. What was the displacement that occurred during this time?
2. An object moving along the $x$-axis initially has a velocity of $60 \mathrm{~m} / \mathrm{s}$ and is slowing down at the rate of $4 \mathrm{~m} / \mathrm{s}$ per second. How far (in meters) will it travel before coming to rest?
3. An accelerating object travels 12 meters from rest in a certain time. How far (in meters) could it have traveled from rest in triple the time?
4. An object's initial velocity is $40 \mathrm{~m} / \mathrm{s}$ and is accelerating. When the object has traveled 300 m , its velocity is $90 \mathrm{~m} / \mathrm{s}$. What is the object's acceleration (in $\mathrm{m} / \mathrm{s}^{2}$ )?
5. An object with constant acceleration and traveling horizontally decreases its velocity from $90 \mathrm{~m} / \mathrm{s}$ to $20 \mathrm{~m} / \mathrm{s}$. During this acceleration period it travels 275 meters. What will be its velocity (in $\mathrm{m} / \mathrm{s}$ ) one second later?
6. An automobile moving at $20 \mathrm{~m} / \mathrm{s}$ accelerates at a rate of $5 \mathrm{~m} / \mathrm{s}^{2}$ for ten seconds. What distance did the automobile travel during the final second of the ten-second period?
7. An object whose initial velocity is $40 \mathrm{~m} / \mathrm{s}$ travels 300 meters in five seconds. What was the object's final velocity?
8. Two cars initially separated by 900 m are traveling away from each other. Car A is moving to the left at $-40 \mathrm{~m} / \mathrm{s}$. Car B is moving at $10 \mathrm{~m} / \mathrm{s}$ to the right and is accelerating at $6 \mathrm{~m} / \mathrm{s}^{2}$. After how many seconds will Car B be 3000 apart ahead of Car A?

## Vertical Motion Problems:

9. A bullet is fired straight upward at $100 \mathrm{~m} / \mathrm{s}$. What will be its velocity three seconds before reaching maximum height?
10. A ball is thrown at a velocity of $-4 \mathrm{~m} / \mathrm{s}$ straight down from the top of a 40 -meter building. After how many seconds will it strike the ground?
11. A ball is thrown straight upward at $20 \mathrm{~m} / \mathrm{s}$ from the top edge of a tall building, reaches maximum height, then falls towards the ground. When will its velocity be $30 \mathrm{~m} / \mathrm{s}$ ?
12. What maximum height will be reached by a bullet fired straight upward at $100 \mathrm{~m} / \mathrm{s}$ ?
13. A ball is thrown straight upward with an initial velocity of $25 \mathrm{~m} / \mathrm{s}$. After how many seconds will it return to the hand of the thrower?
14. At what initial velocity must an arrow be fired straight upward in order that it reach a maximum height of 80 meters?
15. A rock is dropped to the water below from a bridge. It strikes the water 1.8 seconds later. How high above the water is the bridge?

## Chapter 3 Problems

1. A stone is thrown from the top of a 50 -meter tall building at a speed of $16 \mathrm{~m} / \mathrm{s}$ and at an angle of 30 degrees below the horizontal. What will be its speed (in $\mathrm{m} / \mathrm{s}$ ) two seconds later?
2. A ball is kicked from level ground and reaches a maximum height of 12 meters. What must have been the ball's initial vertical speed (in $\mathrm{m} / \mathrm{s}$ )?
3. A bullet is fired at $250 \mathrm{~m} / \mathrm{s}$ horizontally over level ground at an altitude of 1.9 meters. How far (in meters) horizontally will the bullet travel before striking the ground?
4. A golf ball struck on the ground is given an initial speed of $60 \mathrm{~m} / \mathrm{s}$, and initially travels along a line that is inclined $12^{\circ}$ above the ground. How far horizontally will it travel, ignoring the effects of air resistance and other factors, such as the ball's spin?
5. A speedboat has a speed of $40 \mathrm{~m} / \mathrm{s}$ traveling "due" north (zero degrees heading) and is simultaneously accelerating eastward at a rate of $1.4 \mathrm{~m} / \mathrm{s}^{2}$. How far will it travel in the next six seconds?
6. At what firing angle above the horizonal must an arrow, fired at $80 \mathrm{~m} / \mathrm{s}$, be aimed to rise to a maximum height of 200 meters?
7. A golf ball struck on the ground leaves the ground with speed $90 \mathrm{~m} / \mathrm{s}$, traveling initially along an angle of 30 degrees above the horizontal. How far will it be from its starting point three seconds later?

## Chapter 4 Part 1 Problems

1. At what approximate distance from the center of Earth would a $100-\mathrm{kg}$ object weigh 300 N?
2. The gravitational force two objects of equal mass exert on each other is 6000 N . What would be the new force if the separation is tripled, and the mass of each object is doubled?
3. Two blocks are touching on a frictionless tabletop, as shown in the figure below. A force $\mathrm{F}=100 \mathrm{~N}$ is applied horizontally to pair. What is the contact force (in newtons) each block exerts on the other?

4. The block on the frictionless table below has a mass of 40 kg , and its acceleration is $2.0 \mathrm{~m} / \mathrm{s}^{2}$. The force F is directed at an angle of 50 degrees above the horizontal. What is the force F ?

5. Three forces in a plane act on a 600 kg object. With respect to the positive x -axis, measured counter-clockwise, the forces are
$\mathrm{A}=200 \mathrm{~N}, 40^{\circ}$
$\mathrm{B}=160 \mathrm{~N}, 110^{\circ}$
$\mathrm{C}=300 \mathrm{~N}, 270^{\circ}$
What is the acceleration of the object?
6. A falling object has a mass $m=5 \mathrm{~kg}$, and is subject to an air resistance of 9.0 N . How far will it fall in three seconds, dropped from rest?
7. An object of mass 50 kg is seven meters from an object of mass 120 kg . How far from the lighter object would the net gravitational force due to the two objects be zero on a third object of mass m placed between the two?
8. Equal masses M are at three of the vertices of a square whose side length is L . What is the net gravitational force due to the three masses on a fourth identical mass placed at the center of the square? State your answer in terms of the quantities M, G, and L.
9. An object weighing 500 N is placed in an elevator that is accelerating downward. What would have to be the acceleration of the elevator in order that the object's apparent weight be only 100 N ?
10. What would have to be the acceleration of an elevator in order that the "apparent weight" of a passenger be zero?

## Chapter 1 Problem Solutions

| 1. | y |
| :---: | :---: |
| $\mathbf{C}=\mathbf{A}+\mathbf{B}$ |  |
| $\begin{aligned} \mathrm{C}_{\mathrm{x}} & =\mathrm{A}_{\mathrm{x}}+\mathrm{B}_{\mathrm{x}} \\ & =-56+40 \cos 30 \\ & =-21.36 \end{aligned}$ |  |
| $\begin{aligned} C_{y}= & A_{y}+B_{y} \\ = & 0-40 \sin 30 \\ & =-20.00 \end{aligned}$ | $\mathrm{y}$ |
| $\begin{aligned} \mathrm{C} & =\left(\mathrm{C}_{\mathrm{x}}^{2}+\mathrm{C}_{\mathrm{y}}{ }^{2}\right)^{1 / 2} \\ & =\left(21.36^{2}+20.00^{2}\right)^{1 / 2} \\ & =29.26 \mathrm{~km} \end{aligned}$ |  |
| $\begin{aligned} \theta & =\tan ^{-1}(20.00 / 21.36) \\ & =43.12^{\circ} \text { south of west } \end{aligned}$ |  |
| Heading: |  |
| $270-43.12=226.88^{\circ}$ |  |

| 2. | +y |
| :---: | :---: |
| $\mathbf{C}=\mathbf{A}+\mathbf{B}$ | $-\mathrm{x} \longrightarrow \mathrm{Cl}^{\circ}+\mathrm{x}$ |
| $\begin{aligned} C_{x} & =A_{x}+B_{x} \\ & =500 \cos 60-700 \cos 10 \\ & =-439.36 \mathrm{~m} \end{aligned}$ |  |
| $\begin{aligned} C_{y} & =A_{y}+B_{y} \\ & =-500 \sin 60-700 \sin 10 \\ & =-554.57 \mathrm{~m} \end{aligned}$ | North |
| $\begin{aligned} \theta & =\tan ^{-1}(439.37 / 554.57) \\ & =38.39^{\circ} \end{aligned}$ |  |
| Heading: $180+38.39=218.39^{\circ}$ |  |

## Chapter 2 Problem Solutions

$$
\text { 1. } \begin{aligned}
\mathrm{x} & =\overline{\mathrm{v}} \mathrm{t} \\
& =1 / 2\left(\mathrm{v}_{\mathrm{o}}+\mathrm{v}\right) \mathrm{t} \\
& =1 / 2(-40+70) 5 \\
& =75 \mathrm{~m}
\end{aligned}
$$

2. \(\left.\begin{array}{rl} \& v=v_{o}+a t <br>
\& 0=60-4 t <br>

\& t=15 \mathrm{~s}\end{array}\right\}\)| $x=$ | $v_{o} t+1 / 2 \mathrm{at}^{2}$ |
| ---: | :--- |
| $=$ | $60(15)-1 / 2(4) 15^{2}$ |
| $=$ | 450 m |

3. $\mathrm{x}=\mathrm{v}_{\mathrm{o}} \mathrm{t}+1 / 2 \mathrm{at}^{2}$

$$
=0+1 / 2 \mathrm{at}^{2}
$$

Original $\mathrm{x}=1 / 2 \mathrm{at}^{2}$

$$
=12 \mathrm{~m}
$$

New $x=1 / 2 a(3 t)^{2}$
$=1 / 2 a\left(9 t^{2}\right)$
$=9\left[1 / 2 \mathrm{at}^{2}\right]$
$=9(12)$
$=108 \mathrm{~m}$

| 4. $\mathrm{v}^{2}=\mathrm{v}_{\mathrm{o}}^{2}+2 \mathrm{ax}$ |  |
| :--- | ---: |
| $90^{2}=40^{2}+2 \mathrm{a}(300)$ |  |
| $\mathrm{a}=10.83 \mathrm{~m} / \mathrm{s}^{2}$ | $5 . \mathrm{v}^{2}=\mathrm{v}_{\mathrm{o}}{ }^{2}+2 \mathrm{ax}$ |
|  | $20^{2}=90^{2}+2 \mathrm{a}(275)$ |
|  | $\mathrm{a}=-14 \mathrm{~m} / \mathrm{s}^{2}$ |
|  | $\mathrm{v}=\mathrm{v}_{\mathrm{o}}+\mathrm{at}$ |
|  |  |
|  | $=20+(-14)(1)$ |
|  | $=6 \mathrm{~m} / \mathrm{s}$ |

6. 

After nine seconds: $x=20(9)+1 / 2(5) 9^{2}$

$$
=382.5 \mathrm{~m}
$$

After ten seconds: $\quad x=20(10)+1 / 2(5) 10^{2}$

$$
=450.0 \mathrm{~m}
$$

The distance traveled is the difference between the two x-coordinates:

Distance $=450.0-382.5$

$$
=67.5 \mathrm{~m}
$$

7. 

Two ways to calculate average velocity:
First Way:
$\overline{\mathrm{v}}=\mathrm{y} / \mathrm{t}$
= 300/5
$=60 \mathrm{~m} / \mathrm{s}$
Second Way:
$\overline{\mathrm{v}}=60 \mathrm{~m} / \mathrm{s}$
$=1 / 2\left(v_{0}+v\right)$
$=1 / 2(40+v)$
Equate the two expression for $\overline{\mathrm{V}}$ :
$1 / 2(40+v)=60$

$$
\mathrm{v}=80 \mathrm{~m} / \mathrm{s}
$$

| 8. | 9. |
| :---: | :---: |
| $\underline{\text { Car A: }}$ | $\begin{aligned} & \mathrm{v}=\mathrm{v}_{\mathrm{o}}+\mathrm{at} \\ & 0=\mathrm{v}_{\mathrm{o}}-9.8(3) \end{aligned}$ |
| Let the reference zero be at the starting location of Car A: $\begin{aligned} \mathrm{x} & =\mathrm{x}_{\mathrm{o}}+\mathrm{v}_{\mathrm{o}} \mathrm{t}+1 / 2 \mathrm{at}^{2} \\ & =0-40 \mathrm{t}+0 \\ & =-40 \mathrm{t} \end{aligned}$ | $\mathrm{v}_{\mathrm{o}}=29.4 \mathrm{~m} / \mathrm{s}$ |
| Car B: |  |
| Initially, Car B is 900 meters to the right of Car A: $x_{0}=900 \mathrm{~m}$ |  |
| $\begin{aligned} x & =x_{0}+v_{0} t+1 / 2 a t^{2} \\ & =900+10 t+1 / 2(6) t^{2} \end{aligned}$ |  |
| $\begin{aligned} \text { Car B x-coordinate } & =\text { Car A x-coordinate }+3000 \\ 900+10 \mathrm{t}+1 / 2(6) \mathrm{t}^{2} & =-40 \mathrm{t}+3000 \\ \mathrm{t} & =19.41 \mathrm{~s} \end{aligned}$ |  |

| 10. | 11. |
| :---: | :---: |
| Recall: When only one object is in motion, the reference zero mark is most conveniently chosen to be wherever the object was when the observation began-in this case, at the top of the building. <br> The $\mathrm{y}=0$ mark is at the top of the building, so the $y$-coordinate of the bottom of the 40 -meter building is $y=-40 m$. $\begin{aligned} \mathrm{y} & =\mathrm{v}_{\mathrm{o}} \mathrm{t}+1 / 2 \mathrm{at}^{2} \\ -40 & =-4 \mathrm{t}-1 / 2(9.8) \mathrm{t}^{2} \\ \mathrm{t} & =2.48 \mathrm{~s} \end{aligned}$ | Recall: Speed is the magnitude (absolute value) of the velocity. <br> A velocity of $30 \mathrm{~m} / \mathrm{s}$ (speed $=30 \mathrm{~m} / \mathrm{s}$ ) is not achievable moving upward, because the initial upward velocity is only $20 \mathrm{~m} / \mathrm{s}$, and on its way up from the top of the building it's losing velocity, stops, then heads back down. <br> However, after it passes the top of the building on its way back down a velocity of $-30 \mathrm{~m} / \mathrm{s}$ (speed $=30 \mathrm{~m} / \mathrm{s}$ ) is obtainable: $\begin{aligned} v & =v_{o}+a t \\ -30 & =20-9.8 t \\ t & =5.10 \mathrm{~s} \end{aligned}$ |

12. 

Maximum height is reached when the vertical velocity is reduced to zero:
$\mathrm{v}=\mathrm{v}_{\mathrm{o}}+\mathrm{at}$
$0=100-9.8 \mathrm{t}$
$\mathrm{t}=10.20 \mathrm{~s}$

## First Method

$$
\begin{aligned}
\mathrm{y} & =\mathrm{v}_{\mathrm{o}} \mathrm{t}+1 / 2 \mathrm{at}^{2} \\
& =100(10.20)-1 / 2(9.8) 10.20^{2} \\
& =510 \mathrm{~m}
\end{aligned}
$$

## Second Method

$$
\begin{aligned}
\mathrm{y} & =\overline{\mathrm{v}} \mathrm{t} \\
& =1 / 2(100+0)(10.20) \\
& =510 \mathrm{~m}
\end{aligned}
$$

| 13. | 14. |
| :---: | :---: |
| Recall: The point from which motion begins is the "zero" location. So, in returning to the point from which it started, the object's y-coordinate is zero: | $\begin{aligned} & \mathrm{v}^{2}=\mathrm{v}_{\mathrm{o}}^{2}+2 \mathrm{ay} \\ & 0^{2}=\mathrm{v}_{\mathrm{o}}^{2}+2(-9.8) 80 \\ & \mathrm{v}_{\mathrm{o}}=39.60 \mathrm{~m} / \mathrm{s} \end{aligned}$ |
| $\begin{aligned} \mathrm{y} & =\mathrm{vot}_{\mathrm{o}}+1 / 2 \mathrm{at}^{2} \\ 0 & =25 \mathrm{t}-1 / 2(9.8) \mathrm{t}^{2} \\ \mathrm{t} & =5.10 \mathrm{~s} \end{aligned}$ |  |

$$
\begin{aligned}
& 15 . \\
& \begin{array}{l}
\mathrm{y}=\mathrm{v}_{\mathrm{o}} \mathrm{t}+1 / 2 \mathrm{at}^{2} \\
=0+1 / 2(-9.8) 1.8^{2} \\
=-15.88 \mathrm{~m}
\end{array} \\
& 2
\end{aligned} \text { The negative sign affirms what we } \quad \text { expected: The water is } 15.88 \mathrm{~m} .
$$

## Chapter 3 Problem Solutions

| 1. |  |
| :---: | :---: |
| Horizontal: | Vertical: |
| $\begin{aligned} \mathrm{v} & =\mathrm{v}_{\mathrm{o}}+\mathrm{at} \\ & =16 \cos 30+0 \\ & =13.86 \mathrm{~m} / \mathrm{s} \end{aligned}$ | $\begin{aligned} & \mathrm{v}^{2}=\mathrm{v}_{\mathrm{o}}{ }^{2}+2 \mathrm{ay} \\ & 0^{2}=\mathrm{v}_{\mathrm{o}}^{2}+2(-9.8) 12 \\ & \mathrm{v}_{\mathrm{o}}=15.34 \mathrm{~m} / \mathrm{s} \end{aligned}$ |
| Vertical: |  |
| $\begin{aligned} \mathrm{v} & =\mathrm{v}_{\mathrm{o}}+\mathrm{at} \\ & =-16 \sin 30-9.8(2) \\ & =-27.6 \mathrm{~m} / \mathrm{s} \end{aligned}$ |  |
| Speed: |  |
| $\begin{gathered} v=\left(v_{x}{ }^{2}+v_{y}{ }^{2}\right)^{1 / 2} \\ v=\left(13.86^{2}+\right. \\ \left.27.60^{2}\right)^{1 / 2} \\ =30.88 \mathrm{~m} / \mathrm{s} \end{gathered}$ |  |

| 3. | 4. |
| :---: | :---: |
| Vertical: | $\begin{aligned} \text { Rise time } & =(60 \sin 12) / 9.8 \\ & =1.27 \mathrm{~s} \end{aligned}$ |
| $\begin{aligned} y & =v_{0} t+1 / 2 \mathrm{at}^{2} \\ -1.9 & =0+1 / 2(-9.8) \mathrm{t}^{2} \\ \mathrm{t} & =0.623 \mathrm{~s} \end{aligned}$ | $\begin{aligned} \text { Fall time } & =1.27 \mathrm{~s} \\ \text { Total } & =2.54 \mathrm{~s} \end{aligned}$ |
| Horizontal: $\begin{aligned} \mathrm{x} & =\mathrm{v}_{\mathrm{o}} \mathrm{t}+1 / 2 \mathrm{at}^{2} \\ & =250(0.623)+0 \\ & =156 \mathrm{~m} \end{aligned}$ | $\begin{aligned} \mathrm{x} & =(60 \cos 12)(2.54) \\ & =149 \mathrm{~m} \end{aligned}$ |

| 5. $\begin{aligned} \mathrm{y} & =40(6) \\ & =240 \mathrm{~m} \\ \mathrm{x} & =1 / 2(1.4) 6^{2} \\ & =25.2 \mathrm{~m} \\ \mathrm{~d} & =\left(240^{2}+25.2^{2}\right)^{1 / 2} \\ & =241.32 \mathrm{~m} \end{aligned}$ | 6. $\begin{aligned} & \mathrm{v}_{\mathrm{o}}=80 \sin \theta \\ & \mathrm{v}=0 \\ & \overline{\mathrm{v}}=1 / 2(80 \sin \theta+0) \\ & =40 \sin \theta \end{aligned}$ <br> Rise Time $=80 \sin \theta / 9.8$ $\begin{aligned} y & =\overline{\mathrm{v}} \mathrm{t} \\ 200 & =(40 \sin \theta)(80 \sin \theta) / 9.8 \\ \theta & =51.5^{\circ} \end{aligned}$ |
| :---: | :---: |

## Chapter 4 Part 1 Problem Solutions

| 1. <br> $\mathrm{M}=5.98 \times 10^{24} \mathrm{~kg}$ <br> $\mathrm{~m}=100 \mathrm{~kg}$ <br> $\mathrm{G}=6.67 \times 10^{-11} \mathrm{~N}-\mathrm{m}^{2} / \mathrm{kg}^{2}$ | 2. <br> $\mathrm{GMm} / \mathrm{r}^{2}=\mathrm{F}$ <br> $6.67 \times 10^{-11}\left(5.98 \times 10^{24}\right)(100) / \mathrm{r}^{2}=300$ <br> $\mathrm{r}=1.15 \times 10^{7} \mathrm{~m}$ <br> $=6 \mathrm{Gm}^{2} / \mathrm{r}^{2}$ <br> $=6000 \mathrm{~N}$ |
| :--- | :--- |
|  | Solve this problem in two steps. First, get the <br> new force based on the change in m, then use <br> the new force as the starting point for the <br> change in the separation r. |
|  | First, if m is doubled, $\mathrm{m}^{2}$ is quadrupled, which <br> quadruples the numerator, which quadruples F <br> to $24,000 \mathrm{~N}$. |
|  | Second, if r is tripled, the $\mathrm{r}^{2}$ becomes nine <br> times greater denominator becomes nine times <br> greater, which means the force will decrease to <br> one-ninth of its previous value of $24,000 \mathrm{~N}$. <br> The new force therefore is |
| $24,000 / 9=2667 \mathrm{~N}$. |  |

| 5. $\mathbf{D}=\mathbf{A}+\mathbf{B}+\mathbf{C}$ $\mathrm{D}_{\mathrm{x}}=\mathrm{A}_{\mathrm{x}}+\mathrm{B}_{\mathrm{x}}+\mathrm{C}_{\mathrm{x}}$ | 6. $\begin{aligned} \mathrm{F} & =-(5)(9.8)+9.0 \\ & =-40 \mathrm{~N} \end{aligned}$ $\begin{aligned} \mathrm{a} & =\mathrm{F} / \mathrm{m} \\ & =-40 / 5 \\ & =-8.0 \mathrm{~m} / \mathrm{s}^{2} \end{aligned}$ $\begin{aligned} \mathrm{y} & =\mathrm{v}_{\mathrm{o}} \mathrm{t}+1 / 2 \mathrm{at}^{2} \\ & =0+1 / 2(-8.0)(3)^{2} \\ & =-36 \mathrm{~m} \end{aligned}$ <br> Object falls 36 meters. |
| :---: | :---: |
| $\begin{aligned} \mathrm{D}_{\mathrm{x}} & =200 \cos 40-160 \sin 20+0 \\ & =98.49 \mathrm{~N} \end{aligned}$ |  |
| $\begin{aligned} D_{y} & =A_{y}+B_{y}+C_{y} \\ & =200 \sin 40+160 \cos 20-300 \\ & =-21.09 \mathrm{~N} \end{aligned}$ |  |
| $\begin{aligned} \mathrm{D} & =\left(\mathrm{D}_{\mathrm{x}}^{2}+\mathrm{D}_{\mathrm{y}}^{2}\right)^{1 / 2} \\ \mathrm{D} & =\left(98.49^{2}+21.09^{2}\right)^{1 / 2} \\ & =100.72 \mathrm{~N} \end{aligned}$ |  |
| $\begin{aligned} \mathrm{a} & =100.72 / 600 \\ & =0.17 \mathrm{~m} / \mathrm{s}^{2} \end{aligned}$ |  |

| 9. | 10. |
| :---: | :---: |
| $\mathrm{m}=500 / 9.8$ |  |
| $=51.02 \mathrm{~kg}$ | If $\mathrm{C}=0$, the only |
| $\mathrm{C}=100 \mathrm{~N}$ | force acting is the weight force, -mg . |
| $\mathrm{F}=-\mathrm{mg}+\mathrm{C}$ |  |
| $=-500+100$ | $\mathrm{F}=\mathrm{ma}$ |
| $=-400 \mathrm{~N}$ | $-\mathrm{mg}=\mathrm{ma}$ |
|  | $\mathrm{a}=-\mathrm{g}$ |
| $\mathrm{F}=\mathrm{ma}$ | $=-9.8 \mathrm{~m} / \mathrm{s}^{2}$ |
| $\begin{aligned} -400 & =51.02 \mathrm{a} \\ \mathrm{a} & =-7.84 \mathrm{~m} / \mathrm{s}^{2} \end{aligned}$ |  |
